ONBOARDING GUIDE

Multi-Size Ads

A skill that takes an ad you already made and rebuilds it for other placements, so each format looks designed for that shape instead of cropped from another one. Here is what it needs and how it works.

THE OUTPUT

What it does

Rebuilt, not stretched

Each format is generated fresh for its shape: layout rebalanced, background continued, elements repositioned.

Your exact copy

Headlines, sublines and buttons are kept exactly as written. The tool never rewrites your ad copy.

Checked, then shown

Every output is opened and checked: copy, brand, safe zones, artifacts. Misses are flagged, not hidden.

Designer-ready starting points, not finished ads. Every format still gets a design pass before it ships.

YOUR INPUTS

What you set up (once)

Required

Your ad: one image, or a folder of them
Which formats: square, portrait, story, landscape, or all four
A team Gemini key: one shared key, set up once by your team lead

Optional

Nothing else: copy is read off the ad itself
Extra formats: banners and other shapes, on request
A campaign name: just to keep output folders tidy

Claude asks for these in plain language and saves what it needs. You never edit a file or type a command.

INPUTS → SKILL → OUTPUTS

How it works

Your finished ad

The image you already ran
The formats you want
Nothing else to prepare

The skill

Reads the ad and its copy
Shows cost before generating
Rebuilds each format natively

A folder per format

Square, portrait, story, landscape
A review sheet per ad
What passed, what to fix

Legal fine print is deliberately left *blank*. AI cannot render small legal text reliably, so a person pastes yours back in.

CONNECTORS

What it connects to

Claude Code	REQUIRED	The app you actually talk to. It reads this skill, runs every command for you, looks at each generated image…
Python 3	REQUIRED	Runs the engine under the hood. The user never types Python; Claude runs it for them.
Pillow	REQUIRED	Measures every output in the quality check (safe zones, legal band). Claude installs it; generation does not use it.
Gemini API key	REQUIRED	The generative model (gemini-3-pro-image-preview) that natively re-composes each size.

TWO CHOICES, BOTH SIMPLE

Running it

One ad · or · a whole folder

Hand over a single creative or a batch. Before anything is generated you see how many images it will make and what it will cost, and nothing runs until you say go.

Four formats · plus extras on request

Square, portrait, story and landscape are built in and generate natively. Other shapes are possible; Claude explains the tradeoff first.

Start in one line: open Claude Code in the folder and say "set up this skill and walk me through it."

WHAT IT WILL AND WON'T DO

Safe by design

Your copy is never rewritten

Headlines, sublines and buttons stay word for word, and every output is checked against the original.

Nothing is published anywhere

Files land in a folder on your machine. The tool never uploads to an ad platform or sends anything.

Cost is shown before every batch

Image count, expected cost and worst case with retries, then it waits for your go-ahead.

Legal text is left blank on purpose

Small legal copy comes out subtly wrong when generated, so it is never generated. A person adds yours during finishing.
